ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage diseases, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protection or regeneration and treatment of lung or liver fibro reperfusion injury in various tissues and conditions resulting systemic cytokine damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating syndrome associated with ORFX-associated disorder. ORFX polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes substantially purified human protonetered to as open reading frame, ORFX, where X is 1-11491 (see in the specification). ABNIS-762 to ABNIZ-725 encode the human ORFX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The proteins shown in AAY96744-60 are encoded by 17 genes from a CC cluster in Aspergillus terreus (ATCC 20542), which flank the NPKS CC (nonaketide polyketide synthase) gene, which is known to be required for CC (nonaketide polyketide synthase) gene, which is known to be required for CC the entire gene cluster but is not indicated here (see US744350). The CC genes and proteins are named "ORF" or "Lov", where "Lov" signifies genes CC shown to be essential for lovastatin production. The portion of the gene CC cluster between ORF1 and the mid-region of LovF is referred to as the CC "PAB segment". Increasing lovastatin, or monacolin J, production in a CC lovastatin-producing organism, comprises transforming the organism with CC a DAB segment, and expressing it (claimed). Lovastatin will also be CC produced in non-lovastatin producing organisms (e.g. A. nidulans) by CC transformation with the DAB segment and the entire LovF gene. The CC methods are used to increase biosynthetic production of lovastatin (with a least 5-fold increase) which is an anti-hypercholesterolaemic CC agent, and also has some anti-fungal activity. Lovastatin inhibits the CC degent, and also has some anti-fungal activity. Coola) into mevalonate CC by HMG-COA reductase. The methods can also be used to increase production of monacolin J (claimed), which has anti-fungal activity.

The present protein is encoded by one such promoter. The coding sequence for the present protein is useful for modulating the transcription of DNA sequences of interest. The sequences may also be used to tag or identify an organism or its reproductive material.

                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptides and their related polynucleotides are useful in the production of genetic constructs, used for modifying gene expression in a target organism, in particular a plant. The method is useful for modifying expression of a polynucleotide that comprises an intron sequence, through removal of the intron sequence. The method is useful for modifying growth and development of plants, and cellular responses to external stimulus, such as environmental factors and disease pathogens. The sequences are useful in genome and physical mapping, in positional cloning of genes, in various assays to determine biological activity, to raise antibodies, to isolate corresponding interacting proteins and other compounds, and to quantitatively determine levels of interacting proteins or other compounds. Sequences ABU80745-AAU80764 represent Pinus radiata and Eucalyptus grandis polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated promoter sequences from Pinus radiata and Eucalyptus grandis, comprising a sequence chosen from leaf, root, flower, pollen, bud-, meristem-specific promoters or temporally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 13; Page 80-81; 121pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eucalyptus grandis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotides in transgenic plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel polynucleotide promoter sequences from Pine and Eucalyptus useful for modifying expression of endogenous and/or heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Perera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              20-JUN-2000;

                                                                                                                                                                                                                                                                                                                                            pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella
                                                                                                                                                                                                        a wide variety of organisms. The present sequence represents essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prokaryotic genes, their

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fit, wipo.int/pub/published_pct_sequences.

                                         The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen CC programmes. The antisense nucleic acid sequence cell proliferation in a wide variety of organisms. The present sequence represents an CC essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at

          invention users accomproduction of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent W0200177334 (published 18-OCT-2001) which is available in electronic formar directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                            The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the invention helps research in lactic bacteria, particularly useful in the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABB54030 standard;

                     sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids,

The C. glutamicum SMP gene can be used in vectors (II) for expression in host cells and production or modulation of production of fine chemicals, such as, an organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a saturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a cofactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins (III) encoded by them are used for diagnosing the presence or activity of corymebacterium diphtheriae in a subject. (I), (II), (II) or host cells containing them are used to map genomes of organisms related to C. glutamicum, identify and localise C. glutamicum, sequences of interest, in evolutionary studies, in determining SMP protein regions required for function, in modulating SMP protein accivity, in modulating the metabolism of sugars, and in modulating high-energy molecule production in a cell if is a TMP Nandal
